Invenio module with nice defaults for MARC21 overlay.

This is an experimental developer preview release.

- Free software: MIT license
- Documentation: <https://invenio-marc21.readthedocs.io/>

CHAPTER 1

User's Guide

This part of the documentation will show you how to get started in using Invenio-MARC21.

1.1 Installation

1.2 Usage

Invenio module with nice defaults for MARC21 overlay.

CHAPTER 2

API Reference

If you are looking for information on a specific function, class or method, this part of the documentation is for you.

2.1 API Docs

Invenio module with nice defaults for MARC21 overlay.

class `invenio_marc21.ext.InvenioMARC21(app=None)`
Invenio-MARC21 extension.

Extension initialization.

Parameters `app` – An instance of `flask.Flask`.

init_app (`app`)
Flask application initialization.

Parameters `app` – An instance of `flask.Flask`.

init_config (`app`)
Initialize configuration.

Parameters `app` – An instance of `flask.Flask`.

2.1.1 Serializers

Base class for dojson based serializers.

class `invenio_marc21.serializers.dojson.DoJSONSerializer(dojson_model, replace_refs=False)`
Base class for marshmallow serializers.

Initialize serializer.

Parameters

- **dojson_model** – The DoJSON model able to convert JSON through the `do()` function.
- **replace_refs** – Boolean value to configure if the `$ref` keys are replaced. (Default: `False`)

dump (*obj*)

Serialize object with schema.

Parameters *obj* – The object to serialize.

Returns The object serialized.

transform_record (*pid, record, links_factory=None*)

Transform record into an intermediate representation.

Parameters

- **pid** – The `invenio_pidstore.models.PersistentIdentifier` instance.
- **record** – The `invenio_records.api.Record` instance.
- **links_factory** – The link factory. (Default: `None`)

Returns The intermediate representation for the record.

transform_search_hit (*pid, record_hit, links_factory=None*)

Transform search result hit into an intermediate representation.

Parameters

- **pid** – The `invenio_pidstore.models.PersistentIdentifier` instance.
- **record_hit** – A dictionary containing a '`_source`' key with the record data.
- **links_factory** – The link factory. (Default: `None`)

Returns The intermediate representation for the record.

MARC21 based serializer.

```
class invenio_marc21.serializers.marcxml.MARCXMLSerializer(dojson_model,
                                                               xslt_filename=None,
                                                               schema_class=None,
                                                               replace_refs=False)
```

DoJSON based MARCXML serializer for records.

Note: This serializer is not suitable for serializing large number of records due to high memory usage.

Initialize serializer.

Parameters

- **dojson_model** – The DoJSON model able to convert JSON through the `do()` function.
- **xslt_filename** – XSLT filename. (Default: `None`)
- **schema_class** – The schema class. (Default: `None`)
- **replace_refs** – Boolean value to configure if replace the `$ref` keys within the JSON. (Default: `False`)

dump (*obj*)

Serialize object with schema.

Parameters *obj* – The object to serialize.

Returns The object serialized.

serialize(*pid, record, links_factory=None*)

Serialize a single record and persistent identifier.

Parameters

- **pid** – The `invenio_pidstore.models.PersistentIdentifier` instance.
- **record** – The `invenio_records.api.Record` instance.
- **links_factory** – Factory function for the link generation, which are added to the response.

Returns The object serialized.

serialize_oaipmh(*pid, record*)

Serialize a single record for OAI-PMH.

Parameters

- **pid** – The `invenio_pidstore.models.PersistentIdentifier` instance.
- **record** – The `invenio_records.api.Record` instance.

Returns The object serialized.

serialize_search(*pid_fetcher, search_result, item_links_factory=None, **kwargs*)

Serialize a search result.

Parameters

- **pid_fetcher** – Persistent identifier fetcher.
- **search_result** – Elasticsearch search result.
- **item_links_factory** – Factory function for the items in result. (Default: `None`)

Returns The objects serialized.

CHAPTER 3

Additional Notes

Notes on how to contribute, legal information and changes are here for the interested.

3.1 Contributing

Contributions are welcome, and they are greatly appreciated! Every little bit helps, and credit will always be given.

3.1.1 Types of Contributions

Report Bugs

Report bugs at <https://github.com/inveniosoftware/invenio-marc21/issues>.

If you are reporting a bug, please include:

- Your operating system name and version.
- Any details about your local setup that might be helpful in troubleshooting.
- Detailed steps to reproduce the bug.

Fix Bugs

Look through the GitHub issues for bugs. Anything tagged with “bug” is open to whoever wants to implement it.

Implement Features

Look through the GitHub issues for features. Anything tagged with “feature” is open to whoever wants to implement it.

Write Documentation

Invenio-MARC21 could always use more documentation, whether as part of the official Invenio-MARC21 docs, in docstrings, or even on the web in blog posts, articles, and such.

Submit Feedback

The best way to send feedback is to file an issue at <https://github.com/inveniosoftware/invenio-marc21/issues>.

If you are proposing a feature:

- Explain in detail how it would work.
- Keep the scope as narrow as possible, to make it easier to implement.
- Remember that this is a volunteer-driven project, and that contributions are welcome :)

3.1.2 Get Started!

Ready to contribute? Here's how to set up *invenio* for local development.

1. Fork the *invenio* repo on GitHub.
2. Clone your fork locally:

```
$ git clone git@github.com:your_name_here/invenio-marc21.git
```

3. Install your local copy into a virtualenv. Assuming you have `virtualenvwrapper` installed, this is how you set up your fork for local development:

```
$ mkvirtualenv invenio-marc21
$ cd invenio-marc21/
$ pip install -e .[all]
```

4. Create a branch for local development:

```
$ git checkout -b name-of-your-bugfix-or-feature
```

Now you can make your changes locally.

5. When you're done making changes, check that your changes pass tests:

```
$ ./run-tests.sh
```

The tests will provide you with test coverage and also check PEP8 (code style), PEP257 (documentation), flake8 as well as build the Sphinx documentation and run doctests.

6. Commit your changes and push your branch to GitHub:

```
$ git add .
$ git commit -s -m "Your detailed description of your changes."
$ git push origin name-of-your-bugfix-or-feature
```

7. Submit a pull request through the GitHub website.

3.1.3 Pull Request Guidelines

Before you submit a pull request, check that it meets these guidelines:

1. The pull request should include tests and must not decrease test coverage.
2. If the pull request adds functionality, the docs should be updated. Put your new functionality into a function with a docstring.
3. The pull request should work for Python 2.7, 3.3, 3.4 and 3.5. Check https://travis-ci.com/inveniosoftware/invenio-marc21/pull_requests and make sure that the tests pass for all supported Python versions.

3.2 Changes

Version 1.0.0 (released 2018-03-23)

- Initial public release.

3.3 License

MIT License
